

# Blockchain

How Bitcoin works?

A class in data structures:

- **Hash pointers**
- Blockchain

# A normal pointer

Data

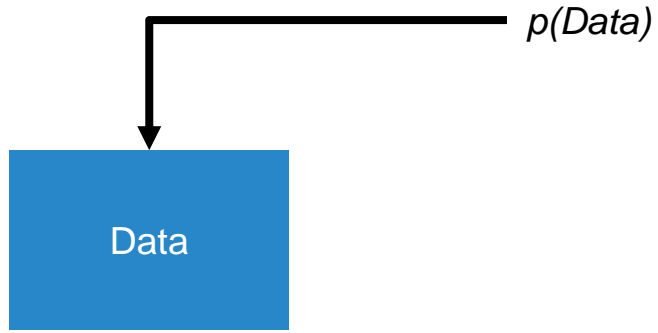

# A normal pointer

$p(Data)$

Data

# A normal pointer

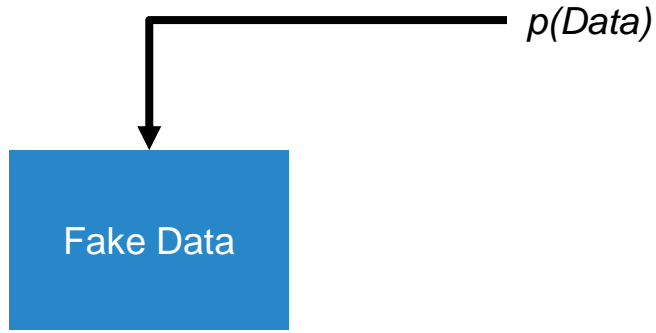

# A normal pointer

What happens if the data changes?

# A normal pointer

What happens if the data changes?

# A normal pointer

What happens if the data changes?

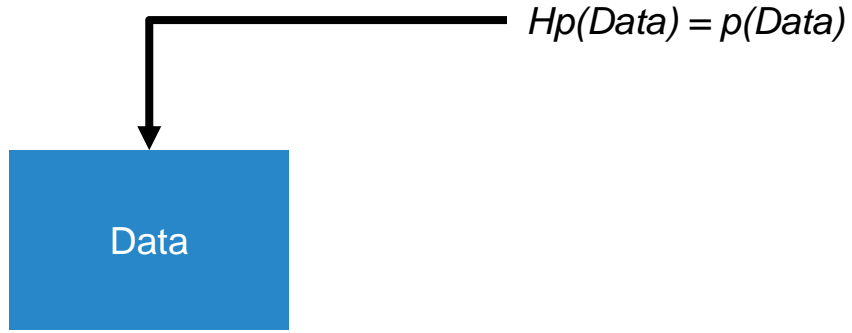

$p$  does not reflect the change!!!

# Hash pointer

# Hash pointer

# Hash pointer

# Hash pointer

What happens if the data changes?

# Hash pointer

What happens if the data changes?

$Hp(Data)$  does not point to Fake Data

# Hash pointer

What happens if the data changes?

$Hp(Data)$  does not point to Fake Data

$H(\text{Fake Data}) \neq H(Data)$

# Hash pointers

Examples of hash pointers:

- If I have a variable
- If my data is in an array
- If my data is in a dictionary (key-value) ← show this

# Hash pointers

Use of hash pointers:

- In any data structure that uses pointers
- Linked lists = blockchain
- Binary trees = Merkle Trees

A class in data structures:

- Hash pointers
- **Blockchain**

# One weakness

**How to make the proof more efficient???**

Narayanan et. Al:

- Chapter 1.2
- Chapter 9.1

# Practice time!!!

Exercizes!!!

- Implement blockchain
- Run against the test data
- Different ways of implementing this

**Let's see the two class we need to implement!!!**
